

ConveGenius Pre-Sales Engine — Admin Guide

Audience: Admins of the Pre-Sales Engine (currently devasheesh@convegenius.ai and aditya.c@convegenius.ai).
Purpose: Everything an admin can do — the controls members don't see, and how to use them to keep the engine accurate and improving over time. **Read first:** the [User Guide](#) covers the everyday workflow (generating, refining, exporting). This guide covers the **admin-only** capabilities on top of that. **Live app:** <https://proposal-engine-beta.vercel.app>

1. What an admin is

Everyone who signs in with an `@convegenius.ai` account is a **member** — they can generate documents, refine, export, view history & analytics, upload to the knowledge base / RFP library, and use the **Research chat** (live web research + drafting, with a model picker). Note for admins: the chat's Opus model and web search cost more than Sonnet/Haiku — worth flagging to the team to use the lightest model that does the job.

Admins can do all of that **plus** manage the engine itself through an **Admin** section in the sidebar that members never see:

Admin capability	Where	What it controls
Curation studio	Sidebar → Curation studio	Best practices, proof points & boilerplate injected into every matching draft
Products & prompts	Sidebar → Products & prompts	The AI instructions behind each product and document type
Costing templates	Sidebar → Costing templates	The CM2 margin model
Team access	Sidebar → Team access	The role model (who's an admin)

If you're an admin, you'll see the **Admin** group at the bottom of the sidebar. If you don't see it, you're signed in as a member.

Admin controls are enforced on the server too — even if someone crafts a request directly, non-admins get a "403 Admins only" response. The hidden menu is convenience; the lock is real.

2. Who is an admin (and how to change it)

Sidebar → Team access.

- Current admins: devasheesh@convegenius.ai, aditya.c@convegenius.ai.
- Everyone else on the domain is a member.
- **To add/remove an admin today:** an engineer updates the `ALLOWED_ADMIN_EMAILS` setting (a comma-separated allowlist) in the app's environment and redeploys. In-app promotion from this screen is a planned enhancement.
- Role is decided by email at sign-in, so changes take effect the next time the person signs in.

3. Curation studio — the most important admin job

Sidebar → Curation studio. This is how the engine gets **stronger over time**. Entries you add here are injected into matching drafts as **authoritative guidance** — they carry more weight than the auto-retrieved knowledge base, because you've explicitly approved them.

3.1 The three entry types

- **Best practice / norm** — rules the model must follow. *Example: "Always anchor PAB notes to the state's Annual Work Plan and cite NAS/UDISE+ evidence before proposing an intervention."*
- **Proof point / fact** — approved figures to reuse verbatim. *Example: "VSK won the PM's National Innovation Award; live across 53,000 schools in Gujarat."* Keep these current and every future draft uses the right numbers.
- **Boilerplate** — standard approved sections to adapt. *Example: a standard SLA or organisational-capability paragraph.*

3.2 Adding or editing an entry (right panel)

1. Pick the **Type** (above).
2. Write a **Title** (how you'll recognise it) and the **Content** (the actual guidance/fact/text).
3. **Scope it** — this controls *where* it's injected:

- **Applies to document types** — tick the generators it's relevant to (e.g. only *RFP response*). None ticked = **all** document types.
- **Applies to products** — tick specific products (e.g. only *VSK 2.0*). None ticked = **all** products.
- **State** — restrict to one state, or leave blank for all.
- **Tags** — for your own organisation.

4. **Add entry** (or **Update entry** when editing).

3.3 Managing entries (left column)

Entries are grouped by type. For each:

- **Toggle** — enable/disable without deleting (disabled entries are kept but **not** injected).
- **Trash** — archive it.
- Click the title to load it into the editor.

3.4 How to curate well

- **Start with proof points.** Your real deployment numbers, awards, and reference contracts are the highest-value, lowest-risk additions — they make every draft concrete and accurate.
- **Scope tightly.** A norm that only applies to PAB notes should be scoped to *PAB proposal note*, so it doesn't clutter unrelated drafts.
- **Keep facts current.** When deployment numbers change, update the proof point once — every future draft follows.
- **Capture wins as norms.** When you learn what framing won a bid, write it as a best-practice entry so the whole team benefits.

4. Products & prompts — editing the AI instructions

Sidebar → **Products & prompts**. Edit the underlying instructions behind each **product** (e.g. VSK 1.0's system prompt) and each **document type** (e.g. how an "RFP response" is structured).

- Left column: **product system prompts** and **generator prompts**. A green **edited** badge marks ones that have been customised.
- Click any row → its prompt opens in the editor.
- Edit and **Save** → your version **overrides the built-in instruction for all future generations, for everyone**.
- **Reset to default** reverts to the original built-in prompt.

Use with care. This changes every draft that uses that product or document type, for the whole team. Make focused edits, and prefer the **Curation studio** for additive guidance (proof points, norms) — it's safer and more granular than rewriting a core prompt. Product and module *names* live in code and aren't edited here; this only changes the AI instructions.

5. Costing templates — the CM2 model

Sidebar → Costing templates. A live CM2 margin calculator, and the model that powers the **CM2 margin analysis** document type.

Schools

15000

Students

Duration (years)

2

☒ Routed via CPSU / implementing partner (adds overhead)

Recalculate

CM2 estimate

Revenue

₹16.08 Cr

CM2

23.9%

₹3.85 Cr

Manpower (PM, implementation, support)	₹4.5 Cr
Technology licensing & platform	₹2.25 Cr
Content & assessment	₹1.29 Cr
Cloud / infrastructure	₹0.96 Cr
Print & delivery	₹0.8 Cr
Travel & field	₹0.8 Cr
Contingency	₹0.48 Cr
CPSU / partner overhead	₹0.96 Cr
CM1	₹5.3 Cr (33%)
Overheads	₹1.45 Cr
CM2	₹3.85 Cr (23.9%)

Illustrative percentage model. The same engine feeds the "CM2 margin analysis" document generator.

- Enter budget (or leave blank to estimate from scale), schools/students, duration, and whether the bid is routed via a CPSU.
- **Recalculate** shows revenue → cost-line breakdown → CM1 → CM2, with the CM2 % flagged.
- The same engine feeds the **CM2 margin analysis** generator, so those internal memos use real numbers.

CM2 figures are **internal**. They are only fed to the CM2 analysis document — they never appear in customer-facing proposals.

6. The knowledge base (shared, but admins should steward it)

The **Knowledge base** and **RFP library** (under *Intelligence*) are open to all members to upload to, but admins should **curate** them:

- Upload your **best winning proposals**, issued RFPs, and SOPs — the engine retrieves relevant ones (by state + keywords) into new drafts automatically.
- Archive low-quality or outdated documents so they don't dilute retrieval.
- Think of it as the engine's "memory": the better the material here, the better future drafts for similar states/topics.

See the User Guide §9–10 for the upload mechanics.

7. How the engine improves over time — the admin loop

Put together, the admin's job is a continuous loop:

1. **Win or lose a bid** → record the outcome (Won/Lost) on the proposal.
2. **Capture the learning** → add a best-practice **norm** (what framing worked) and any new **proof points** (new deployment, new numbers) in the Curation studio.
3. **Bank the asset** → upload the winning proposal to the **knowledge base**.
4. **Tune if needed** → adjust a product or generator **prompt** only when a systematic change is required.

Do this consistently and every new draft starts from a stronger base than the last.

8. What's not yet available (planned)

These were scoped but are not built yet — so you know the current boundaries:

- **Semantic (meaning-based) retrieval** from the knowledge base (today it's keyword + state matching).
- **One-click "promote a won proposal into the knowledge base."**
- **Structured Won/Lost reason capture** that feeds analytics and curation automatically.
- **Prompt change history / who-changed-what** with revert.
- **In-app admin promotion** (today admins are set via the environment allowlist).

9. Admin responsibilities checklist

- ☐ Keep **proof points** current in the Curation studio (deployments, awards, numbers).
- ☐ Add a **best-practice norm** after each notable win or loss.
- ☐ Upload winning proposals & issued RFPs to the **knowledge base**; archive stale ones.

- ☐ Review **prompt edits** before saving — they affect everyone.
- ☐ Keep the **admin list** tight; remove people who no longer need it.
- ☐ Don't upload anything to shared stores you wouldn't want the whole pre-sales team to see.
